9.1.2 Nested Nested Code Block

Code Block

```
1  /* Prime modulus multiplicative linear congruential generator
2  Z[i] = (630360016 * Z[i-1]) (mod(pow(2,31) - 1)), based on Marse
   and Roberts'
3  portable FORTRAN random-number generator UNIRAN. Multiple (100)
   streams are
4  supported, with seeds spaced 100,000 apart. Throughout, input
   argument
5  "stream" must be an int giving the desired stream number. The
   header file
6  lcgrand.h must be included in the calling program (#include "
   lcgrand.h")
7  before using these functions.
8
9  Usage: (Three functions)
10
11  1. To obtain the next U(0,1) random number from stream "stream,"
   execute
12     u = lcgrand(stream);
13     where lcgrand is a float function. The float variable u will
   contain the
14     next random number.
15
```

```

16 2. To set the seed for stream "stream" to a desired value zset,
    execute
17     lcgrandst(zset, stream);
18     where lcgrandst is a void function and zset must be a long
    set to the
19     desired seed, a number between 1 and 2147483646 (inclusive).
    Default
20     seeds for all 100 streams are given in the code.
21
22 3. To get the current (most recently used) integer in the
    sequence being
23     generated for stream "stream" into the long variable zget,
    execute
24     zget = lcgrandgt(stream);
25     where lcgrandgt is a long function. */
26
27 /* Define the constants. */
28
29 #define MODLUS 2147483647
30 #define MULT1 24112
31 #define MULT2 26143
32
33 /* Set the default seeds for all 100 streams. */
